SUMMARY

AI Automation Engineer with 6 years of engineering experience and 2+ years building production AI systems for client businesses. I run engagements end to end: requirements gathering, build, deployment, staff training and post-launch support. Deep in Python, Node.js, n8n and the OpenAI and Anthropic APIs, with vector-store retrieval and multi-agent routing running in production. I design for the failure path as much as the happy path, with idempotency, retry handling and human review gates built in from the start.

SKILLS

Automation:

n8n (self-hosted), GoHighLevel (GHL), Make.com, Zapier, Docker

AI & APIs

OpenAI API, Assistants API, Anthropic / Claude API, Gemini API, Grok API, Vapi Voice API, RAG / Vector Stores, MCP

Languages

Python (FastAPI), JavaScript (Node.js), TypeScript, Kotlin, SQL, Dart

Databases

Supabase, PostgreSQL, NoSQL, Firebase, MySQL

System Integrations

Monday.com, Google Workspace (Gmail, Sheets, Calendar, Drive), WhatsApp Business API, Cloudinary, JSON2Video, REST APIs, Facebook Graph API

Engineering Core

Git, GitLab, CI/CD, Docker, Architecture Design, Unit Testing, E2E Testing

AI Developer Tools

Claude Code (multi-agent: dev, QA, PM, DevOps), MCP, Prompt & Context Engineering, Model Routing

EXPERIENCE

AI Automation Engineer (Remote)	Freelance / Contract	Feb 2025 - Present
- Architected and deployed an autonomous AI customer inquiry pipeline on self-hosted n8n and the OpenAI API for a multi-branch automotive service business, replacing 100% of manual message routing across 3 branches and cutting reply times from days to under 30 seconds at any hour. - Built reliability into every workflow: idempotency keys so retries cannot double-send, circuit breakers and dead letter queues with replay so one failing provider cannot take down a run, and confidence gating that routes low-certainty model output to a human review queue instead of a customer. - Developed a production inbound voice agent with Vapi and n8n that answers calls in under 5 seconds and books appointments directly into CRM calendars. - Engineered an automated lead management engine using GoHighLevel and custom Python, cutting lead-to-response time to under 60 seconds. - Programmed Python and Node.js microservices, secure REST APIs and webhook processors backing the agent workflows, with Supabase and PostgreSQL for state, audit trails and vector-store retrieval. - Migrated a client from Make.com to self-hosted n8n on their own infrastructure, and completed Meta App Review and Business Verification for production API access.		
Android Developer (Ortigas Pasig)	Seven Seven Global Services (Assigned to UnionBank)	Mar 2025 – Mar 2026
- Delivered features to production for a consumer banking Android app in Kotlin, Jetpack Compose and MVVM, working with the client POC on requirements and with team leads on releases. - Optimized system architecture and debugged production environments via Dynatrace logs and traces, driving a 20% reduction in application crash rates. - Managed automated GitLab CI/CD pipelines and resolved critical SonarQube findings to meet quality gates, and mentored junior developers through onboarding, architecture walkthroughs and code reviews.		
Senior Android Engineer (Makati City)	Disrupt'em	Apr 2024 – Feb 2025
- Programmed custom Python and JavaScript (Node.js) backend services, microservices, secure REST APIs and automated tools supporting core system functionality. - Boosted application data performance by 25% by optimizing local device resource management and restructuring API data handling payloads. - Architected and maintained CI/CD automation pipelines eliminating manual deployment errors, and owned Google Play releases end to end including store requirements and compliance, with zero rejections.		

PROJECTS

liquidity-hq.com — Financial Market Intelligence Platform

Built and shipped a full-stack platform for retail traders overwhelmed by market information volume. Runs scheduled background automation that processes market news/data and structures relevant signals; integrated Grok LLM to help interpret market conditions and support trading decisions.

<https://liquidity-hq.com/>

Reconciliation & Resilience Pipeline

Built a self-healing reconciliation system using FastAPI, Redis, n8n, Supabase and OpenAI. Idempotent ingestion rejects duplicate transactions, AI classification routes low-confidence results to manual review, and a circuit breaker with dead letter queue recovers automatically from live provider outages.

PropConnect AI Voice Agent

Engineered inbound/outbound real-estate voice AI scripts via Vapi and n8n to qualify and book live appointments into GHL CRM calendars autonomously.

MultiSales AI

Built a production-grade chatbot framework handling autonomous sales routing via n8n, OpenAI Assistants API, and Meta Graph API.

Smart Lead Routing System

Created a microservice using n8n and Supabase to ingest incoming webhook payloads, classify leads, and trigger sub-60-second SMS marketing workflows.

EDUCATION

(BS Information Technology)	Batangas State University (The National Engineering University)	2020 – 2024
